

Dashboard Link | Founder One-Pager

Generated from the current repo structure on 2026-04-06. Dashboard Link is a multi-tenant SaaS product for field-service teams. Managers create worker records, add schedules and tasks, send a secure SMS link, and then confirm whether each worker opened their mobile dashboard.

What It Does

- Solves the "where do I go, what do I do, and what is the access code?" problem for deskless workers.
- Uses SMS instead of app installs, logins, or chat threads, so casual and rotating staff can open their day plan in one tap.
- Keeps the manager in control: workers, schedules, tasks, tokens, plugins, SMS history, and dashboard-open tracking all sit in one admin flow.
- Current MVP launch path is manual data entry first, with plugin integrations available in the repo for Google Calendar, Airtable, Notion, and manual sync.

Core Product Flow

1. Manager logs into the admin portal.
2. Manager creates or updates workers.
3. Manager adds schedule items and task items, mainly through Manual Data.
4. Manager sends a secure dashboard link by SMS.
5. Worker opens the mobile dashboard from the SMS, sees today's schedule and tasks, and can refresh to get updates.
6. Manager checks SMS delivery and dashboard-open history to confirm the message was actually received and opened.

What The App Contains

- 'apps/admin': manager-facing React app for operations and setup.
- 'apps/worker': public worker-facing React app opened from an SMS link.
- 'apps/api': Hono + Node API for auth, worker data, tokens, SMS, plugins, and public dashboard redemption.
- 'packages/auth': authentication providers and auth utilities.
- 'packages/database': repositories and data-access layer.
- 'packages/shared': shared types, schemas, contracts, and validators.
- 'packages/sms': provider abstraction and SMS queue/service logic.
- 'packages/tokens': token generation and validation support.
- 'packages/ui': shared UI kit, auth components, loading states, and worker access components.
- 'supabase': schema, RLS policies, and indexes.

Admin Pages

- '/login' LoginPage: branded access screen with 'MagicLinkAuth'; supports password login, magic-link login, and signup.
- '/' DashboardPage: overview screen with quick actions, KPI cards ('DashboardStats'), recent activity ('RecentActivity'), and an MVP workflow checklist.
- '/workers' WorkersPage: searchable/filterable worker roster with 'WorkerList' plus modal-based 'WorkerForm' for create and edit.
- '/workers/:id' WorkerDetailPage: three-tab worker record with 'WorkerProfile', 'WorkerActions', 'SmsHistory', and 'AccessLogHistory'.
- '/manual-data' ManualDataPage: worker selector, date-range filter, tabs for schedule vs tasks, list view, and add/edit forms for both item types.
- '/tokens' TokensPage: token stats, filters, token table, revoke/regenerate controls, and bulk cleanup for expired tokens.
- '/sms-logs' SMSLogsPage: delivery log table, resend action, and filters by worker, status, date, and search term.
- '/plugins' PluginsPage: plugin cards, enable/disable controls, configuration modal, and connection test action.
- '/settings' SettingsPage: organization details, editable defaults, usage summary placeholder, and destructive controls in 'DangerZone'.

Worker Pages

- '/' LandingPage: simple instruction page that tells workers to use the SMS link they received.
- '/dashboard/:token' DashboardPage: token-gated mobile dashboard with 'WorkerAccess', refresh control, pull-to-refresh, 'ScheduleWidget', 'TasksWidget', and empty states.
- '/error/invalid-token' InvalidTokenPage: explains cancelled, used, or malformed links and directs the worker to request a new one.
- '/error/expired-token' ExpiredTokenPage: explains time-limited access and tells the worker how to get a fresh link.
- '/error/not-found' NotFoundPage: fallback for bad routes.

Major Components

- Admin shell: 'Navigation', 'ProtectedRoute', 'PageSkeleton', toast notifications, and auto-refresh behavior.
- Worker management: 'WorkerList', 'WorkerCard', 'WorkerForm', 'DeleteWorkerDialog', 'WorkerProfile', 'WorkerActions'.
- Manual content: 'ManualDataList', 'ScheduleItemForm', 'TaskItemForm'.
- Messaging and access: 'SMSModal', 'SMSLogTable', 'SmsHistory', 'AccessLogHistory', 'TokenTable', 'TokenActions'.
- Integrations and settings: 'PluginCard', 'PluginConfigForm', 'OrganizationForm', 'DangerZone'.
- Worker experience: 'WorkerAccess', 'ScheduleWidget', 'TasksWidget', 'ErrorLayout', 'PageSkeleton'.
- Shared UI base: buttons, cards, modals, inputs, tabs, loading spinners, and auth widgets live in 'packages/ui'.

API And Data Setup

- Public API: dashboard token redemption, worker dashboard by token, and provider webhooks.
- Protected API: worker CRUD, worker stats, access logs, manual schedule/tasks CRUD, SMS send/send-link/logs, token list/stats/revoke/regenerate, plugin CRUD/test, dashboard stats, and organization lookup.
- Middleware: auth, tenant scoping, rate limiting, cache, and global error handling.
- Data model: Supabase/Postgres stores workers, dashboard tokens, SMS logs, access logs, schedule items, task items, organizations, and adapter configs.
- Security posture: tenant isolation is enforced through organization scoping and Supabase RLS policies; worker links are time-limited and can be revoked.

Best Refinement Levers

- Worker dashboard content: what fields matter most on the day view.
- Manager workflow: whether the MVP should stay manual-first or push harder on integrations.
- SMS behavior: wording, timing, resend rules, expiry length, and read-confirmation reporting.
- Plugins: which integrations are truly launch-critical versus nice-to-have.
- Commercial setup: branding, analytics, billing, and whether the admin app needs a stronger mobile owner-operator experience.
